*Transmissible Spongiform Encephalopathies*: Bruce W. Chesebro,2013-11-11 In spite of a long history of intense investigation the transmissible spongiform encephalopathies remain a poorly understood family of neurodegenerative diseases. This group of diseases has been described in a wide variety of animal species and includes kuru, Creutzfeldt-Jakob disease, and Gerstmann-Straussler syndrome in humans, and scrapie, bovine spongiform encephalopathy, and related syndromes in ruminants and rodents. In all cases spongiform degeneration and astrogliosis are seen in specimens of brain and a filterable transmissible agent is present in the brain and some other tissues of affected individuals. However, the precise nature of this agent remains unknown. Agent infectivity, which can so far only be assayed by serial transmission to new individuals, be remarkably resistant to inactivation has been shown to by heat, chemicals, and irradiation. These properties create significant biohazard possibilities during exposure to infected tissues. Transmission between humans was originally recognized in the unique epidemiology of kuru in New Guinea tribesmen, and concern about transmission from animals to humans has re-emerged as a result of the current epidemic of bovine spongiform encephalopathy in dairy cattle in Great Britain. Although interspecies transmission has often been achieved experimentally, its efficiency is highly variable. Therefore, the possibility of spread of bovine spongiform encephalopathy from cattle to humans or various animal populations cannot be accurately predicted at this time. This volume presents a comprehensive update of knowledge concerning the transmissible spongiform encephalopathies.

*The Molecular Repertoire of Adenoviruses III* Walter Doerfler, Petra Böhm, 2012-12-06 For decades this virus system has served--and continues to do so--to pioneer investigations on the molecular biology, biochemistry and genetics of mammalian cell systems. This three volume work presents an up-to-date account of recent basic research in one of the most important experimental systems for biochemical, cell biological, genetic, virological and epidemiological investigation in mammalian molecular biology. In the first of the three volumes, we present an overview of adenovirus research. In the second volume, we turn our attention to such topics as DNA replication, recombination and integration and post-transcriptional control. This, the third volume then looks at transformation and E1A, adenovirus genetics, pathogenesis and gene therapy.

**Redirection of Th1 and Th2 Responses** Robert L. Coffman, Sergio Romagnani, 2013-03-09 The two major subsets of CD4+ helper T cells, designated Th1 and Th2, have quite different patterns of cytokine production and, as a consequence, have very different roles in immune responses. The articles in this volume review both basic and clinical studies of T cell heterogeneity, including: the mechanisms by which Th1 and Th2 cells develop and maintain their differences in cytokine production; the different roles of Th1 and Th2 cells in allergy, autoimmunity and infectious diseases; the prospects and strategies for therapeutic manipulation of Th1 and Th2 cells; and the control of Th1 and Th2 responses by regulatory T cell subsets. The volume should give the reader a view of the development and function of Th1 and Th2 cells and the attempts to treat immunological diseases with therapies directed towards altering the Th1/Th2 balance.

*Nature-Inspired Algorithms for Optimisation* Raymond Chiong, 2009-05-02 Nature-Inspired Algorithms have been gaining much popularity in recent years due to the fact that many real-world optimisation problems have become increasingly large, complex and dynamic. The size and complexity of the problems nowadays require the development of methods and solutions whose efficiency is measured by their ability to find acceptable results within a reasonable amount of time, rather than an ability to guarantee the optimal solution. This volume 'Nature-Inspired Algorithms for Optimisation' is a collection of the latest state-of-the-art algorithms and important studies for tackling various kinds of optimisation problems. It comprises 18 chapters, including two introductory chapters which address the fundamental issues that have made optimisation problems difficult to solve and explain the rationale for seeking inspiration from nature. The contributions stand out through their novelty and clarity of the algorithmic descriptions and analyses, and lead the way to interesting and varied new applications.

Light Absorption of Organic Colorants J. Fabian, H. Hartmann, 2013-11-11 Although studies on synthetic dyes have been performed for more than 100 years, their detailed elucidation requires further extensive research. The discovery of novel high polymers, the necessity of supplying a whole range of shades and increasing requirements for dyestuffs of high fastness properties give rise to a permanent search for new dyes. Extensive investigations on dyes were also occasioned by various applications in the field of spectral sensitization and of staining of biological specimens. Another more recent development concerns the lasing properties of some organic dyes. Most of the progress, however, was only achieved by time-consuming, purely empirical approaches and theoretical understanding of the dye properties is only at its very beginnings. The color is the sine qua non of every dye. For this reason organic chemists and color chemists have looked for relations between the color and constitution of dye molecules for a long time. This knowledge as a whole is known as theory of color. The classic theory of color was established about 100 years ago by Witt and was significantly extended 50 years later by W. König.
